2.

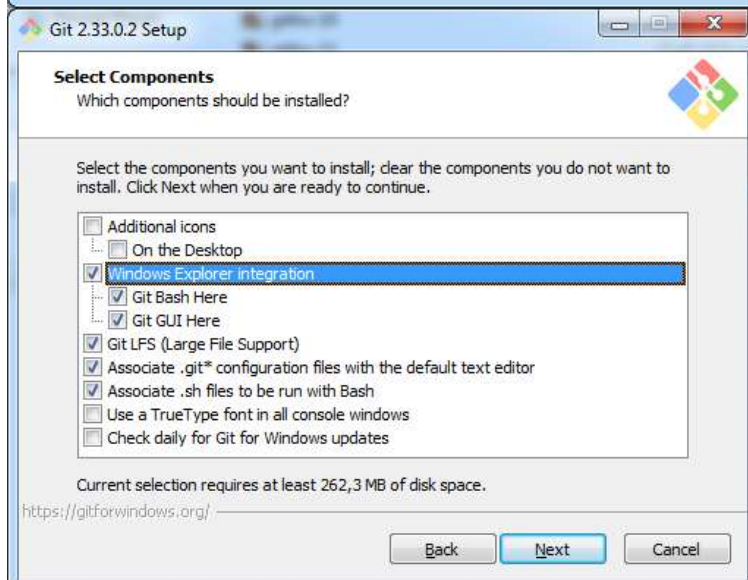

Run the installer

3.

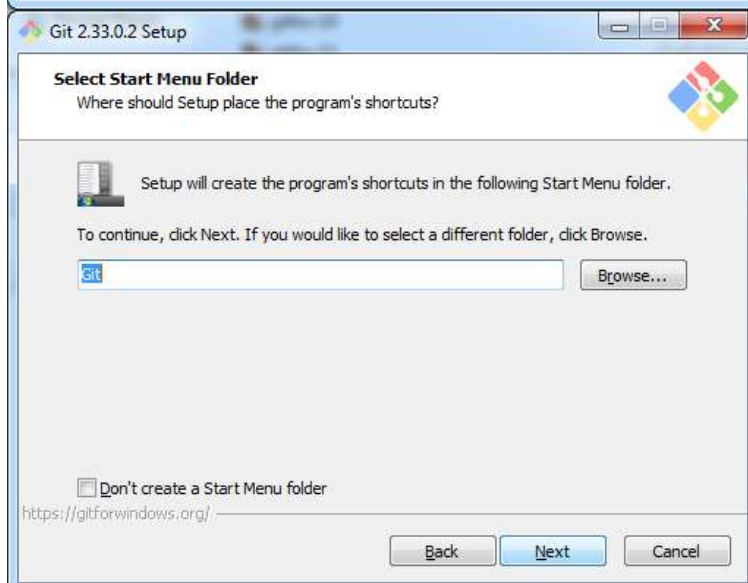

We can leave default values for almost all of the steps of the installer.

4.

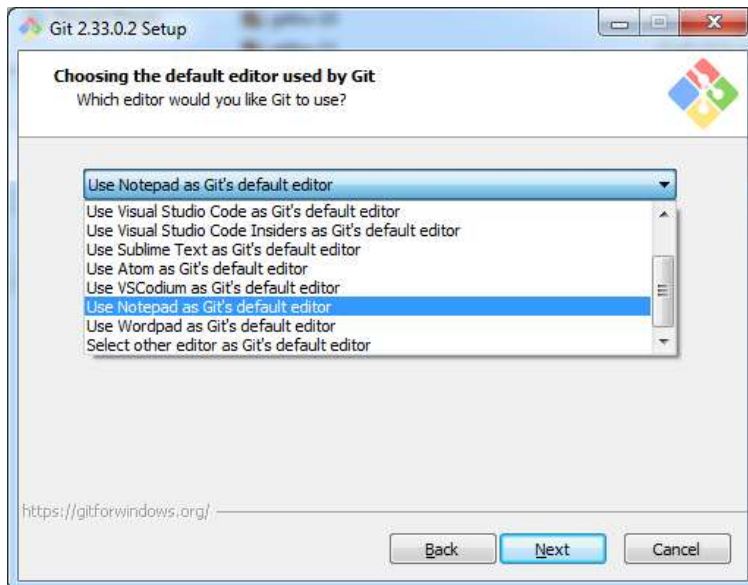

If you are sure that you are not going to use git from command-line, you can leave "Windows Explorer integration" unchecked. While being checked, it'll bring you two new menu items to the windows folder context menu available by right click.

5.

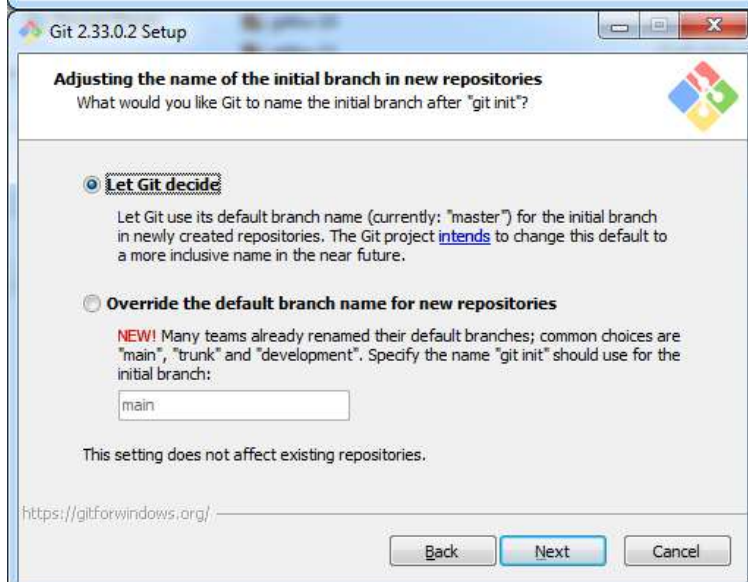

6.

If you don't know, what is the "git default editor", just select Notepad on this step.

You can always change it later if you'll want.

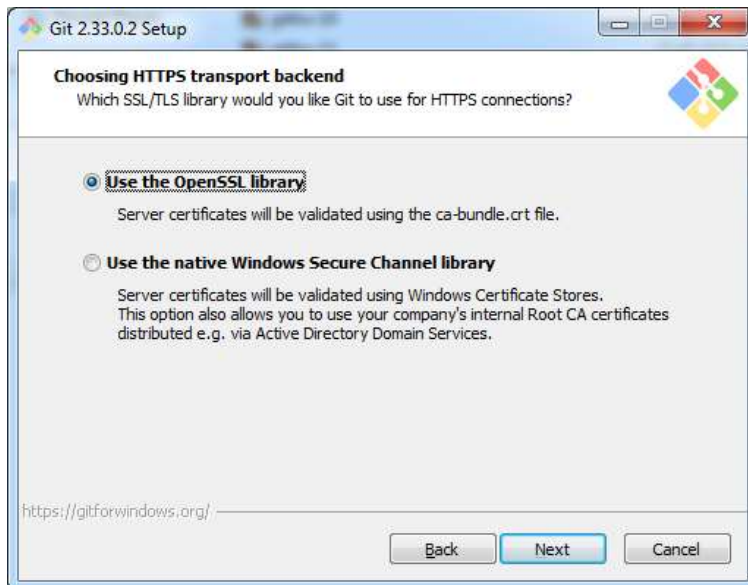

7.

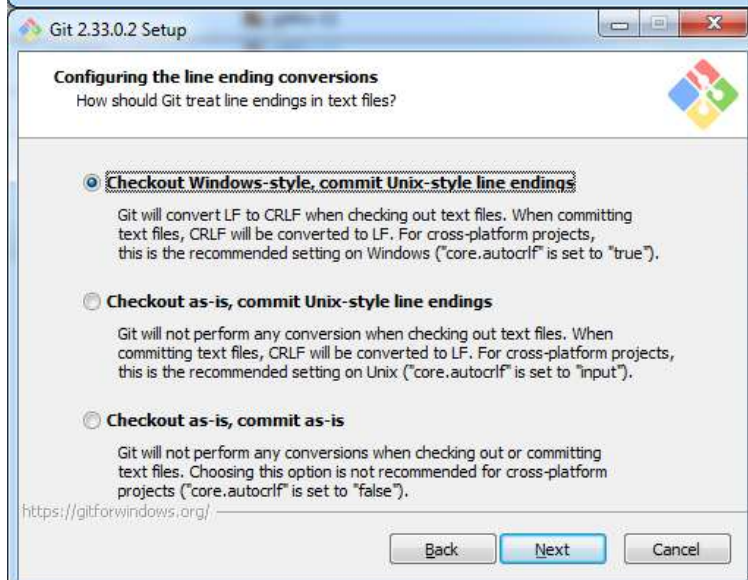

8.
